**Final Year Project (C) 478 – Project Approval Form**

Name of Supervisor	Student Name and Number
Prof TM Louw	EK Hickling (21553750)
<b>Project Title</b>	
Data reconciliation for advanced process monitoring of a distillation column	
<b>Project Description and Objectives</b>	
Data reconciliation is a method used to leverage redundant measurements along with conservation equations to filter measurements and reduce instrument noise, for enhanced process monitoring and control. Data reconciliation may also be extended to detect gross errors such as sensor failure. The goal of this project will be to assess the use of data reconciliation for enhanced process monitoring of a distillation column, specifically for fault detection related to sensor failure.	
<b>Project Outcome and Deliverables</b>	
<p>The following requirements must be met for the project to be considered successful:</p> <ul style="list-style-type: none"> <li>• Implementation and validation of a dynamic model of a distillation column, under simplified conditions.</li> <li>• Implementation and assessment of data reconciliation for improved measurement accuracy for the model plant.</li> <li>• Implementation and assessment of gross error detection to identify simulated sensor failures for the model plant.</li> <li>• Critical analysis of the benefits and challenges associated with data reconciliation.</li> </ul>	
<b>Project Characteristics and Requirements</b>	
<p><b>Applicability to Chemical Engineering:</b> The student must engage with selected knowledge in the research literature of the chemical engineering discipline. Briefly describe the relevance of this project to chemical engineering.</p> <p>The project considers the use of advanced data analytics for process monitoring, which is relevant to the operation of all chemical- or minerals processing plants. The selected case study represents an important unit operation in many chemical processing plants.</p>	
<p><b>References:</b> Are sufficient literature sources available and accessible to support this topic? Provide at least two examples.</p> <p>(1) Crowe, C. M. (1996). Data reconciliation—progress and challenges. <i>Journal of process control</i>, 6(2-3), 89-98.  (2) Tong, H., &amp; Crowe, C. M. (1995). Detection of gross errors in data reconciliation by principal component analysis. <i>AIChE Journal</i>, 41(7), 1712-1722.  (3) Özyurt, D. B., &amp; Pike, R. W. (2004). Theory and practice of simultaneous data reconciliation and gross error detection for chemical processes. <i>Computers &amp; chemical engineering</i>, 28(3), 381-402.</p>	
<p><b>Infrastructure, Resources and Funding:</b> Are there special infrastructure, resource, or funding requirements for this project? If so, specify how these will be provided.</p> <p>All simulations and analyses will be conducted using MATLAB. No additional funding is required.</p>	
<b>ECSA Graduate Attributes</b>	
<p><b>2. Application of scientific and engineering knowledge:</b> Apply knowledge of mathematics, natural sciences, engineering fundamentals and an engineering speciality to solve complex engineering problems.</p> <p>Knowledge of the following areas of mathematics and/or natural science and/or engineering fundamentals shall be applied:</p> <ul style="list-style-type: none"> <li>• Process Modelling and control</li> <li>• Separations technology</li> </ul> <p>Sufficient complexity shall be captured in:</p> <ul style="list-style-type: none"> <li>• The implementation of a complex dynamic model of an important operation</li> <li>• The implementation and evaluation of an advanced process monitoring strategy</li> </ul>	
<p><b>4. Investigations, experiments, and data analysis:</b> Demonstrate competence to design and conduct investigations and experiments.</p> <p>Design a series of computationally intensive simulated experiments with stochastic inputs. Critically analyse the results of the simulated experiments using appropriate statistical tools.</p>	

**Department of Process Engineering**  
**Final Year Project (C) 478 – Project Approval Form**

<b>6. Professional and technical communication:</b> Demonstrate competence to communicate effectively, both orally and in writing, with engineering audiences and the community at large.		
A well-structured, well-written, professional technical report shall be submitted for assessment. In addition, oral and poster presentations shall be delivered to examiners as part of the formal assessment.		
<b>8. Individual, team, and multidisciplinary work:</b> Demonstrate competence to work effectively as an individual, in teams and in multidisciplinary environments.		
The student shall work under the guidance of a supervisor. The supervisor shall provide sound, professional advice, and administrative support, but shall not do the work on behalf of the student. The student shall, therefore, demonstrate competence to interact, devise and conduct the investigation effectively as an individual, as follows: <ul style="list-style-type: none"> <li>Regularly meet with the supervisor (including taking minutes of meetings).</li> <li>Implement an advanced process simulation using scientific computing software.</li> <li>Analyse and interpret results using appropriate statistical techniques.</li> <li>Present findings in a report and during oral presentations, all though individual efforts.</li> </ul>		
<b>9. Independent learning ability:</b> Demonstrate competence to engage in independent learning through well-developed learning skills.		
The student shall engage, independently and without formal lecturing, with new theoretical and/or practical concepts. Key concepts and skills to be mastered independently are: <ul style="list-style-type: none"> <li>The implementation of a dynamic model with realistic stochastic disturbances using appropriate scientific computation software;</li> <li>Studying and applying concepts related to process monitoring which are not covered in the undergraduate curriculum, including data reconciliation and gross error detection</li> </ul>		
<b>Criteria for continuation of project (items to be delivered by June)</b>		
<ul style="list-style-type: none"> <li>Implementation of a dynamic model of a distillation tower with stochastic disturbances.</li> <li>Rudimentary implementation of a data reconciliation strategy for improved measurement accuracy</li> </ul>		
<b>Sign-off:</b> This project has been registered and reviewed by the Department of Process Engineering and accepted as suitable for a Final Year Project.
